

Winter Seminar 2018

Transport Safety

24th and 25th January 2018
Brussels, Le Plaza Hotel

Transport Safety

Transportation of gases and equipment by road can often be the highest risk activity for gas companies and their providers of transport services. Complying with legislative and regulatory requirements of operating a transport fleet needs to be supplemented with actions specific for the industrial and medical gases industry to prevent one of our drivers or vehicles from being involved in a serious incident.

It is critical that gas companies and transportation companies have processes in place to reduce the risk of serious vehicle incidents.

Vehicle incident investigations have shown that the majority of these incidents are avoidable and that the causes include:

- A lack of training or knowledge
- People's ability to react to high risk situations
- Human behaviour
- Inadequate organisation and management processes

In our Seminar, industry and external experts will address these causes and will provide guidance and examples of good practices in a range of areas including:

- Driver training
- Risks on the road
- Using technology
- Behaviours and distractions
- Contractor management
- Incident management

Who should attend?

Transport and distribution management personnel, senior leaders, functional specialists and engineers from the bulk, cylinder and homecare sectors, representing gas companies and contractors. Experts and those new to the industry. Regulatory and government officers. Representatives of industrial gas associations, equipment manufacturers and suppliers, consultants, competent authorities, customers and business partners.

The preliminary programme for the Winter Seminar will be available on the EIGA website from mid-July 2017.

EIGA - European Industrial Gases Association AISBL • Avenue des Arts 3-5 • B-1210 Brussels
